BACKGROUND SUMMARY

School lunch programs have been a continuing concern to National PTA and the California State PTA. Since 1944, the National PTA has supported the National School Lunch Program bill. In May 1974, the State PTA voted to support the Child Nutrition Act of 1974 which authorized school districts to apply for state and federal funds to assist schools in serving nourishing low-cost meals to children, and to provide free or reduced price meals to children from low-income families.

Nutrition programs have been shown to have a significant positive effect on children’s nutritional status and learning ability:

- A U.S. Department of Agriculture study of the lunch and breakfast programs, *The National Evaluation of School Nutrition Programs, 1983*, demonstrated that these programs make nutritional improvements in children’s diets. The report of the study stated: “The superiority of the school lunch program is reflected in higher daily intake of nutrients for the general school age population and for all the population subgroups that were examined.” In addition, the school breakfast program was shown to increase the likelihood that children will eat breakfast.

- A 1987 study in Boston, Massachusetts, documented improvements in achievement test scores, tardiness rates and absenteeism after a breakfast program was introduced.

- The recent studies carried out in carefully controlled “laboratory” settings have revealed that skipping breakfast negatively affects children’s performance in problem-solving situations similar to ones they face in a classroom setting.

PTA advocates that every school have a school nutrition policy. This policy can be used to teach school officials, school board members, school food services personnel, teachers, parents and students about the relationship between nutrition and learning, and about what schools can do to ensure that nutritional conditions are optimum for learning. Moreover, it helps schools plan improvements in the nutritional environment of their students.

The nutritional goals during childhood are to provide optimally for the needs of growth, physical development, athletics and academic performance while, at the same time, avoiding early physical symptoms and behaviors related to chronic diseases. Most experts agree that health extends beyond normal growth and development into the early prevention of obesity, heart disease, high blood pressure and osteoporosis. However, there is concern about doing harm through overly restrictive diets during critical periods of development or contributing to the problem of hunger among vulnerable groups. The nutrition guidelines for all school foods, as established by the State Department of Education, are a sound basis for the service of school nutrition programs and for all food and beverage sales on school campuses.
